Introduction

This directory provides information on the production of native species seed in Iowa for 2016. The certification of native species plants is not based upon genetic standards. Instead, it provides a method for seed growers to certify the seed's collection source for the assurance of the consumer. This assurance is important to consumers since many native plants and seeds on the market do not have a guarantee of their place of origin. When a consumer purchases seed labeled with a Source Identified class yellow label, they can be confident of its geographic origin and area of adaptation.

Both field and seed inspections are made on each of the species listed in this directory. The seed produced cannot be classified as certified Source Identified until it has passed field inspection, seed testing has been completed, and the seed is properly labeled. Prior to buying seed from a grower herein listed, the purchaser should inquire as to whether the seed production process has been completed. A certified Source Identified label on the container is assurance the seed meets specifications.

Further explanation of the Native Species program, the producers, and listing of species inspected in 2016 can be found in the remainder of the directory.

What is the Native Species Program?

Iowa Crop Improvement Association (ICIA) initiated the Native Species Program in 1994 with the certification of 10 species. Several organizations contributed significantly to the development of this program and continue to assist in steering the program today:

Tallgrass Prairie Center, University of Northern Iowa
Living Roadway Trust Fund, Iowa Department of Transportation
USDA-NRCS, Iowa Office
USDA-NRCS Elsberry Plant Materials Center

As a member of the Association of Official Seed Certifying Agencies (AOSCA), ICIA is one of many states who offer the certification of native grasses, forbs, and woody plants under a common set of guidelines and requirements set by AOSCA.

Seed sold as Source Identified class is comprised of two components:

1. Seed collected privately
2. Seed collected for the Iowa Ecotype Project

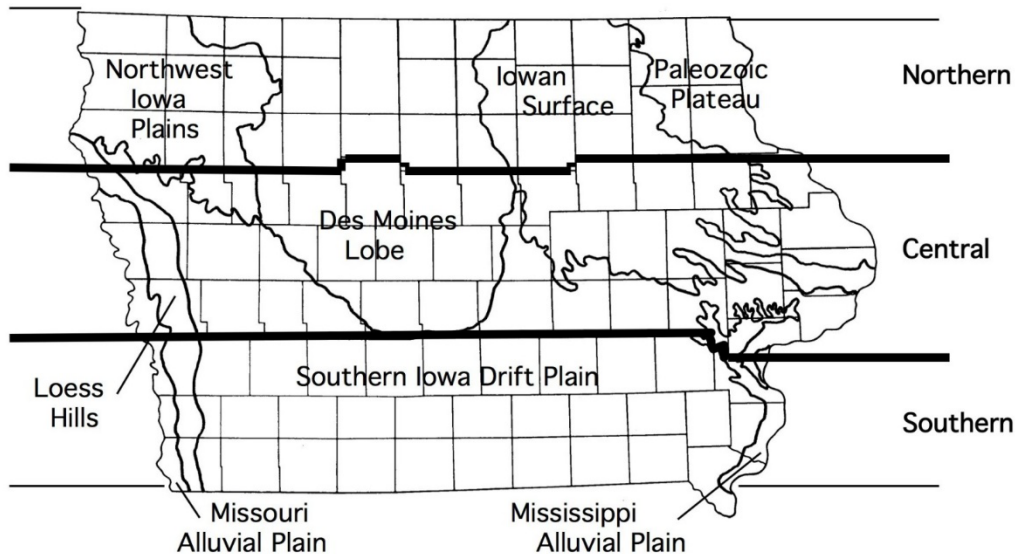

The following paragraphs describe the components of the Source Identified program. All of the seed certified as Source Identified class has been collected from the remnants of the vast prairie that once covered the Midwest.

Private Collection

The biggest component of seed certified as Source Identified class is that which is privately collected. Hours of work go into locating and identifying a native site, receiving approval for the collection of seed, and then the harvest and cleaning of seed. Typically, two or more seasons are required to increase the seed to a marketable quantity. An applicant applying for certification of privately collected seed is required to submit germplasm collection documentation. This documentation identifies and describes the specific location from which the seed was collected. An ICIA inspector checks the site to verify that it is “native”.

Iowa Ecotype Project

The second component of seed in the program is part of the Tallgrass Prairie Center’s Iowa Ecotype Project. The Iowa Ecotype Project, which began in 1990, is funded in part by the Iowa Department of Transportation’s Living Roadway Trust Fund. Its purpose is to provide a commercially available seed supply of native prairie plants of Iowa origin. For the purpose of this project, Iowa is divided into three regions, north to south, with about three tiers of counties in each region. Parent seed is collected from Iowa remnant prairie communities in each of these regions, and initially increased at the Tallgrass Prairie Center, with some species increased at the regional USDA-NRCS Plant Materials Center in Elsberry, MO. The seed is subsequently released to qualified native seed growers in or very near to Iowa. When applying for certification, seed growers receiving and planting this seed submit a label they receive from the Tallgrass Prairie Center to document the origin of the seed and the region in which it was collected. Iowa Ecotype Project seed is sold and labeled under the trade name “Natural Selections™”.

Iowa Ecotype Project seed collection regions. Currently the Loess Hills are excluded from the Project. Growers may produce seed anywhere in Iowa or within one county of it’s borders.

Botanical Name Cross Reference

Botanical names continue to change as more information is discovered. In 2007 ICIA worked closely with the Tallgrass Prairie Center and the Iowa Department of Transportation to adopt the most current botanical name for each species. This cross reference lists the former botanical name along with the new one that is used in this directory.
